

# 2018 Water Quality Report for Charter Township of Alpena

This report covers the drinking water quality for Charter Township of Alpena for the 2018 calendar year. This information is a snapshot of the quality of the water that we provided to you in 2018. Included are details about where your water comes from, what it contains, and how it compares to United States Environmental Protection Agency (U.S. EPA) and state standards.

Our fresh water source is surface water from Thunder Bay in Lake Huron. This has been the source of drinking water in Alpena since 1905. Over the last 41 years, state and federal environmental regulations have progressively become more stringent resulting in significant improvements in Great Lakes water quality. The State performed an assessment of our source water to determine the susceptibility or the relative potential of contamination. The susceptibility rating is on a seven-tiered scale from "very-low" to "very-high" based on geologic sensitivity, well construction, water chemistry and contamination sources. The susceptibility of our source is highly susceptible to potential contamination. The assessment is completed and copies are available upon request. The City of Alpena and the Charter Township of Alpena closely monitor both the source and the treated drinking water supplied to you to ensure its quality and safety. The sample data shows that it is of the highest quality. The water sample results presented in the following report are technical in nature, and our goal is to help you understand how the data supports the safety of consuming drinking water treated by the City of Alpena and provided by the Charter Township of Alpena Department of Public Works. If you have any questions about the contents of this report, please contact the office at 989-356-0297.

**Contaminants and their presence in water:** Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that

water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the U.S. EPA's Safe Drinking Water Hotline (800-426-4791).

**Vulnerability of sub-populations:** Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune systems disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. U.S. EPA/Center for Disease Control guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

**Sources of drinking water:** The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. Our water comes from wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

**Contaminants that may be present in source water include:**

- **Microbial contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.
- **Inorganic contaminants**, such as salts and metals, which can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- **Pesticides and herbicides**, which may come from a variety of sources such as agriculture and residential uses.

- **Radioactive contaminants**, which can be naturally occurring or be the result of oil and gas production and mining activities.
- **Organic chemical contaminants**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.

In order to ensure that tap water is safe to drink, the U.S. EPA prescribes regulations that limit the levels of certain contaminants in water provided by public water systems. Federal Food and Drug Administration regulations establish limits for contaminants in bottled water which provide the same protection for public health.

## Water Quality Data

The table below lists all the drinking water contaminants that we detected during the 2018 calendar year. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. Unless otherwise noted, the data presented in this table is from testing done January 1 through December 31, 2018. The State allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year. All the data is representative of the water quality, but some are more than one year old.

### Terms and abbreviations used below:

- Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
- Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
- Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
- Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
- Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.
- N/A: Not applicable
- ND: not detectable at testing limit
- ppt: parts per trillion
- ppb: parts per billion or micrograms per liter
- ppm: parts per million or milligrams per liter
- pCi/l: picocuries per liter (a measure of radioactivity).
- Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

1 Monitoring Data for Regulated Contaminants

Regulated Contaminant	MCL, TT, or MRDL	MCLG or MRDLG	Level Detected	Range	Year Sampled	Violation Yes/No	Typical Source of Contaminant
Nitrate (ppm)	10	10	0.18	N/A	2018	NO	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits
Fluoride (ppm)	2	2	0.67	0.46-0.82	2018	NO	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories
Sodium <sup>1</sup> (ppm)	N/A	N/A	7.6	N/A	2018	NO	Erosion of natural deposits
Chloride (ppm)	250	N/A	10	N/A	2018	NO	Erosion of natural deposits
Sulfate (ppm)	250	N/A	21	N/A	2018	NO	Naturally occurring mineral
Calcium <sup>1</sup> (ppm)	N/A	N/A	24	N/A	2016	NO	Naturally occurring element
Magnesium <sup>1</sup> (ppm)	N/A	N/A	6.7	N/A	2016	NO	Naturally occurring element
Aluminum (ppm)	0.2	N/A	0.08	ND - 0.39	2014	NO	Naturally occurring element
pH	6.5- 8.5	N/A	7.1	6.9-7.4	Daily	NO	Naturally occurring element
Hardness CaCO <sub>3</sub> (ppm)	N/A	N/A	115	96-150	Daily	NO	Naturally occurring element
TTHM Total Trihalomethanes (ppb)	80	N/A	72	44-110	2018	NO	Byproduct of drinking water disinfection
HAA5 Haloacetic Acids (ppb)	60	N/A	29	4.6-58	2018	NO	Byproduct of drinking water disinfection
Chlorine <sup>2</sup> (ppm)	4	4	RAA= 0.69	0.11 - 1.23	2018	NO	Water additive used to control microbes
Alpha emitters (pCi/L)	15	0	2.3	N/A	2015	NO	Erosion of natural deposits
Combined radium (pCi/L)	5	0	0.46	N/A	2015	NO	Erosion of natural deposits

<sup>1</sup> Sodium, Calcium, Magnesium is not a regulated contaminant.

<sup>2</sup> The chlorine "Level Detected" was calculated using a running annual average.

Dalapon (ppb)	200	200	0.53	ND-0.53	2018	NO	Runoff from herbicide
Turbidity NTU Filtered Water	1	N/A	0.11	0.03-0.11	Daily	NO	Soil runoff
Turbidity % of samples Filtered water	95% < 0.3 NTU	N/A	100%	N/A	Daily	NO	Soil runoff
Total Coliform (total number or % of positive samples/month)	TT	N/A	0	N/A	2018	NO	Naturally present in the environment
E. coli in the distribution system (positive samples)	See E. coli note <sup>3</sup>	0	0	N/A	2018	NO	Human and animal fecal waste
Fecal Indicator – E. coli at the source (positive samples)	TT	N/A	0	N/A	2018	NO	Human and animal fecal waste
Inorganic Contaminant Subject to Action Levels (AL)	Action Level	MCLG	Your Water <sup>4</sup>	Range of Results	Year Sampled	Number of Samples Above AL	Typical Source of Contaminant
Lead (ppb)	15	0	3	ND-94	2017	1	Lead service lines, corrosion of household plumbing including fittings and fixtures; Erosion of natural deposits
Copper (ppm)	1.3	1.3	.10	0.001-0.360	2017	0	Corrosion of household plumbing systems; Erosion of natural deposits

<sup>3</sup> *E. coli* MCL violation occurs if: (1) routine and repeat samples are total coliform-positive and either is *E. coli*-positive, or (2) the supply fails to take all required repeat samples following *E. coli*-positive routine sample, or (3) the supply fails to analyze total coliform-positive repeat sample for *E. coli*.

<sup>4</sup> Ninety (90) percent of the samples collected were at or below the level reported for our water.

## Additional Monitoring

Unregulated contaminants are those for which the U.S. EPA has not established drinking water standards. Monitoring helps the U.S. EPA determine where certain contaminants occur and whether regulation of those contaminants is needed.

Unregulated Contaminant Name sampled at plant tap	Level Detected	Range	Year Sampled	Comments / Likely Source
PFAS (ppt)	ND	ND	2018	Results of monitoring are available upon request
PFOA (ppt)	ND	ND	2018	Results of monitoring are available upon request
PFOS (ppt)	ND	ND	2018	Results of monitoring are available upon request
Hexavalent Chromium (ppb)	0.10	0.07-0.10	2013	Erosion of natural deposits
Strontium(ppb)	110	91-110	2013	Naturally occurring element
Vanadium (ppb)	0.30	N/D-0.30	2013	Naturally occurring element
Chlorate (ppb)	180	66-180	2013	By product from disinfection process
Unregulated Contaminant Name sampled in distribution system	Level Detected	Range	Year Sampled	Comments / Likely Source
Chlorate (ppb)	170	71-170	2013	By product from disinfection process
Hexavalent Chromium (ppb)	0.14	0.08-0.14	2013	Erosion of natural deposits
Strontium(ppb)	110	93-110	2013	Naturally occurring element
Vanadium (ppb)	0.30	N/D-0.30	2013	Naturally occurring element

**Information about lead:** If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. [NAME OF UTILITY] is responsible for providing high quality drinking water but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

Infants and children who drink water containing lead in excess of the action level could experience delays in their physical or mental development. Children could show slight deficits in attention span and learning abilities. Adults who drink this water over many years could develop kidney problems or high blood pressure.

Copper is an essential nutrient, but some people who drink water containing copper in excess of the action level over a relatively short amount of time could experience gastrointestinal distress. Some people who drink water containing copper in excess of the action level over many years could suffer liver or kidney damage. People with Wilson's Disease should consult their personal doctor.

Monitoring and reporting to the Department of Environmental Quality (DEQ) Requirements: The State of Michigan and the U.S. EPA require us to test our water on a regular basis to ensure its safety. We met all the monitoring and reporting requirements for 2018.

We will update this report annually and will keep you informed of any problems that may occur throughout the year, as they happen. Copies are available at the Charter Township of Alpena office at your request. This report will not be sent to you.

We invite public participation in decisions that affect drinking water quality. The township council meets the 2<sup>nd</sup> Tuesday and Last Tuesday of every month at the township offices. For more information about your water, or the contents of this report, contact the Charter Township of Alpena at 989-356-0257 or go to [www.alpenatownship.com](http://www.alpenatownship.com). For more information about safe drinking water, visit the U.S. EPA at <http://www.epa.gov/safewater/lead>.
